## Project 1

Create a CLI (Command Line Interface) contact book that allows users to:

- Add a new contact (append to file)
- View all contacts (read from file)
- Search for a contact (read and filter)
- Handle file-related exceptions (e.g., file not found)

**File Used:**

**contacts.txt (stores contact info: Name, Phone)**

CODE:

```
import os
```

```
FILENAME = "contacts.txt"
```

```
def add_contact(name, phone):
```

```
    try:
```

```
        with open(FILENAME, "a") as f:
```

```
            f.write(f'{name},{phone}\n')
```

```
        print("Contact added successfully.")
```

```
    except Exception as e:
```

```
        print("Error while adding contact:", e)
```

```
def view_contacts():
```

```
    try:
```

```
        with open(FILENAME, "r") as f:
```

```
            contacts = f.readlines()
```

```
            if not contacts:
```

```
                print("No contacts found.")
```

```
            for line in contacts:
```

```

        name, phone = line.strip().split(",")

        print(f'Name: {name}, Phone: {phone}')

except FileNotFoundError:

    print("No contacts file found.")

except Exception as e:

    print("Error while reading contacts:", e)

def search_contact(keyword):

    try:

        with open(FILENAME, "r") as f:

            found = False

            for line in f:

                name, phone = line.strip().split(",")

                if keyword.lower() in name.lower() or keyword in phone:

                    print(f'Name: {name}, Phone: {phone}')

                    found = True

            if not found:

                print("No matching contact found.")

    except FileNotFoundError:

        print("No contacts file found.")

while True:

    print("\n--- Contact Book ---")

    print("1. Add Contact")

    print("2. View All Contacts")

    print("3. Search Contact")

    print("4. Exit")

    choice = input("Enter choice: ")

```

```
if choice == "1":  
    n = input("Enter name: ")  
    p = input("Enter phone: ")  
    add_contact(n, p)  
elif choice == "2":  
    view_contacts()  
elif choice == "3":  
    k = input("Enter name/phone to search: ")  
    search_contact(k)  
elif choice == "4":  
    break  
else:  
    print("Invalid choice")
```

OUTPUT:

```
--- Contact Book ---
1. Add Contact
2. View All Contacts
3. Search Contact
4. Exit
Enter choice: 1
Enter name: test name
Enter phone: 9812122334
Contact added successfully.

--- Contact Book ---
1. Add Contact
2. View All Contacts
3. Search Contact
4. Exit
Enter choice: 2
Name: test name, Phone: 9812122334

--- Contact Book ---
1. Add Contact
2. View All Contacts
3. Search Contact
4. Exit
Enter choice: 3
Enter name/phone to search: test
Name: test name, Phone: 9812122334

--- Contact Book ---
1. Add Contact
2. View All Contacts
3. Search Contact
4. Exit
Enter choice: 4
```

## Project 2

Create a simple banking system that:

- Stores customer info in a file
- Allows deposits and withdrawals using functions
- Updates customer balance
- Logs all transactions in a separate file
- Handles exceptions gracefully

Files Used:

customers.txt — stores customer records in the format:

**Name,AccountNumber,Balance**

**transactions.txt — appends every deposit or withdrawal record with timestamp**

CODE:

```
import os
```

```
from datetime import datetime
```

```
CUSTOMER_FILE = "customers.txt"
```

```
TRANSACTION_FILE = "transactions.txt"
```

```
def load_customers():
```

```
    customers = {}
```

```
    try:
```

```
        with open(CUSTOMER_FILE, "r") as f:
```

```
            for line in f:
```

```
                name, acc, bal = line.strip().split(",")
```

```
                customers[acc] = {"name": name, "balance": float(bal)}
```

```
    except FileNotFoundError:
```

```
        pass
```

```
    return customers
```

```
def save_customers(customers):
```

```
    with open(CUSTOMER_FILE, "w") as f:
```

```
        for acc, data in customers.items():
```

```
            f.write(f'{data["name"]},{acc},{data["balance"]}\n')
```

```
def log_transaction(acc, action, amount):
```

```
    with open(TRANSACTION_FILE, "a") as f:
```

```
        f.write(f'{datetime.now()}, {acc}, {action}, {amount}\n')
```

```
def deposit(customers, acc, amount):
    if acc in customers:
        customers[acc]["balance"] += amount
        log_transaction(acc, "Deposit", amount)
        print("Deposit successful.")
    else:
        print("Account not found.")

def withdraw(customers, acc, amount):
    if acc in customers:
        if customers[acc]["balance"] >= amount:
            customers[acc]["balance"] -= amount
            log_transaction(acc, "Withdraw", amount)
            print("Withdrawal successful.")
        else:
            print("Insufficient balance.")
    else:
        print("Account not found.")

def create_account(customers, name, acc, bal):
    if acc in customers:
        print("Account already exists.")
    else:
        customers[acc] = {"name": name, "balance": bal}
        print("Account created successfully.")

customers = load_customers()
```

```
while True:

    print("\n--- Banking System ---")
    print("1. Create Account")
    print("2. Deposit")
    print("3. Withdraw")
    print("4. View All Customers")
    print("5. Exit")
    choice = input("Enter choice: ")

    if choice == "1":
        n = input("Enter name: ")
        a = input("Enter account number: ")
        b = float(input("Enter initial balance: "))
        create_account(customers, n, a, b)

    elif choice == "2":
        a = input("Enter account number: ")
        amt = float(input("Enter amount: "))
        deposit(customers, a, amt)

    elif choice == "3":
        a = input("Enter account number: ")
        amt = float(input("Enter amount: "))
        withdraw(customers, a, amt)

    elif choice == "4":
        for acc, data in customers.items():
            print(f'Name: {data['name']}, Acc: {acc}, Balance: {data['balance']}")
```

```
elif choice == "5":  
    save_customers(customers)  
    break  
  
else:  
    print("Invalid choice")
```

OUTPUT:

```
--- Banking System ---  
1. Create Account  
2. Deposit  
3. Withdraw  
4. View All Customers  
5. Exit  
Enter choice: 1  
Enter name: test name  
Enter account number: 0022  
Enter initial balance: 5000  
Account created successfully.  
  
--- Banking System ---  
1. Create Account  
2. Deposit  
3. Withdraw  
4. View All Customers  
5. Exit  
Enter choice: 4  
Name: test name, Acc: 0022, Balance: 5000.0  
  
--- Banking System ---  
1. Create Account  
2. Deposit  
3. Withdraw  
4. View All Customers  
5. Exit  
Enter choice: 3  
Enter account number: 0022  
Enter amount: 3000  
Withdrawal successful.
```
